05-2 Userspace Initialization - systemd

Beagle 3.8

bone$ **cat /etc/init.d/README**

```
You are running a systemd-based OS where traditional init scripts have
been replaced by native systemd services files. Service files provide
very similar functionality to init scripts. To make use of service
files simply invoke "systemctl", which will output a list of all
currently running services (and other units). Use "systemctl
list-unit-files" to get a listing of all known unit files, including
stopped, disabled and masked ones. Use "systemctl start
foobar.service" and "systemctl stop foobar.service" to start or stop a
service, respectively. For further details, please refer to
systemctl(1).
```

Beagle 3.8 (cont)

bone$ **cat /etc/init.d/README**

```
Note that traditional init scripts continue to function on a systemd
system. An init script /etc/init.d/foobar is implicitly mapped
into a service unit foobar.service during system initialization.

Thank you!

Further reading:
        man:systemctl(1)
        man:systemd(1)
        http://0pointer.de/blog/projects/systemd-for-admins-3.html

http://www.freedesktop.org/wiki/Software/systemd/Incompatibilities
```

http://en.wikipedia.org/wiki/Systemd

systemd

- init.d is not used on the Bone
- systemd is used for user space initialization
- http://www.freedesktop.org/wiki/Software/systemd/
- Faster boot time by allowing initialization in parallel

systemd adoption of major Linux distributions

Linux distribution	Date added to software repository[a]	Enabled by default?	Can run without?	Date released as default
Android	N/A (not in repository)	N/A	Yes	N/A
Arch Linux	January 2012[40]	Yes	Yes, but unsupported[41]	October 2012[42]
CentOS	April 2014	Yes	No	April 2014 (7.14.04)
CoreOS	July 2013	Yes	?	October 2013 (v94.0.0)[43][44]

cgroup - Which Service Owns Which Processes?

- One process can start other processes
- It's hard to tell which process runs what
- *Control groups* (cgroups) are groups of processes
- In systemd every process that is spawned is placed in a control group named after its service
- Makes it easier to track down problems

cgroup

```
bone$ systemd-cgls
Control group /:
-.slice
├─user.slice
│ └─user-1000.slice
│   ├─user@1000.service

```

Outline

- Being an Admin
  - Monitoring boot up
  - cgroup
  - Stopping, starting, etc.
  - Boot time
- Running your own server

Managing

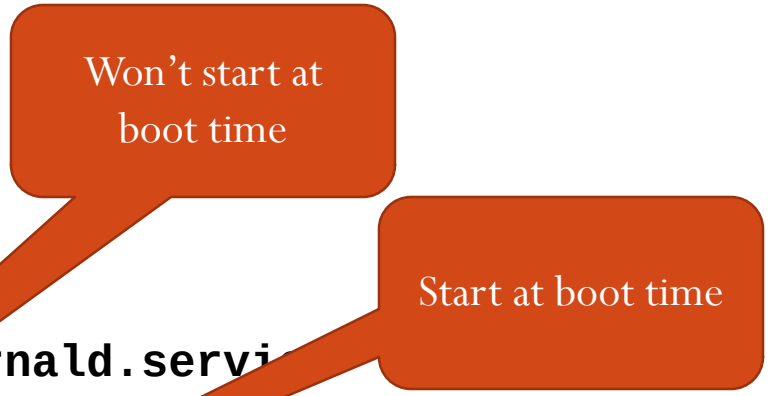
bone$ **systemctl status systemd-journald.service**

```
● systemd-journald.service - Journal Service
   Loaded: loaded (/lib/systemd/system/systemd-journald.service; static; vendor preset:
enabled)
   Active: active (running) since Thu 2016-11-03 13:16:44 EDT; 11 months 2 days ago
     Docs: man:systemd-journald.service(8)
           man:journald.conf(5)
 Main PID: 205 (systemd-journal)
   Status: "Processing requests..."
    Tasks: 1 (limit: 4915)
   CGroup: /system.slice/systemd-journald.service
           └─205 /lib/systemd/systemd-journald

Nov 03 13:16:44 bone-0834 systemd-journald[205]: Journal started
Nov 03 13:16:44 bone-0834 systemd-journald[205]: Runtime journal
(/run/log/journal/035732fb7bb3a80710a1e
Nov 03 13:16:45 bone-0834 systemd-journald[205]: Runtime journal
(/run/log/journal/035732fb7bb3a80710a1e
Warning: Journal has been rotated since unit was started. Log output is incomplete or
unavailable.
```

Managing

- Stop, start, disable, enable



```
bone$ systemctl stop systemd-journald.service
Warning: Stopping systemd-journald.service, but it can still be activated by:
  systemd-journald.socket
bone$ systemctl start systemd-journald.service
bone$ systemctl disable systemd-journald.service
bone$ systemctl enable systemd-journald.service
The unit files have no [Install] section. They are not meant to be enabled
using systemctl.
Possible reasons for having this kind of units are:
1) A unit may be statically enabled by being symlinked from another unit's
   .wants/ or .requires/ directory.
2) A unit's purpose may be to act as a helper for some other unit which has
   a requirement dependency on it.
3) A unit may be started when needed via activation (socket, path, timer,
   D-Bus, udev, scripted systemctl call, ...).
```

```

Outline

- Being an Admin
  - Monitoring boot up
  - cgroup
  - Stopping, starting, etc.
  - Boot time
- Running your own server

Autostarting a server

- For and example, let's use the server in

```
bone$ cd exercises/realtime
bone$ ./boneServer.js
 Listening on 9090
    info  - socket.io started
```

- How do you write your own service script?

Find a working script

```
bone$ systemctl | grep bone
bonescript-autorun.service  loaded active running   Bonescript autorun
bonescript.service          loaded active running   Bonescript server
bonescript.socket           loaded active running   bonescript.socket
```

- I see a couple of bonescript servers that look promising.

```
bone$ systemctl status bonescript
bonescript.service - Bonescript server
   Loaded: loaded (/lib/systemd/system/bonescript.service; static)
   Active: active (running) since Sun 2000-01-09 15:07:55 EST; 13 years 9 months ago
   Main PID: 357 (node)
         CGroup: name=systemd:/system/bonescript.service
            `-357 /usr/bin/node server.js

Jan 09 15:07:55 yoder-black-bone systemd[1]: Starting Bonescript server...
Jan 09 15:08:04 yoder-black-bone bonescript[357]: [35B blob data]
Jan 09 15:08:05 yoder-black-bone bonescript[357]: - - - [Sun, 09 Jan 2000 20:...
```

Copy

```
bone$ cp /lib/systemd/system/bonescript.service boneServer.service
bone$ cat boneServer.service
[Unit]
Description=Bonescript server

[Service]
WorkingDirectory=/usr/lib/node_modules/bonescript
ExecStart=/usr/bin/node server.js
SyslogIdentifier=bonescript

[Install]
WantedBy=multi-user.target
```

Environment Variables

- Node.js also needs

```
bone$ echo $NODE_PATH
/usr/lib/node_modules
```

- You get to figure out how to set it

Install

```
bone$ cp boneServer.service /lib/systemd/system
```

- Start the server

```
bone$ systemctl start boneServer
```

- Point your browser to 192.168.7.2:9090 and see if it works.
- To make it work after rebooting

```
bone$ systemctl enable boneServer
```

```
ln -s '/lib/systemd/system/boneServer.service'
'/etc/systemd/system/multi-user.target.wants/boneServer.service‘
```

- Reboot and see if it worked
