

04-3 Toolchains

Embedded Linux system development

Cross-compiling toolchains

Definition (1)

- ▶ The usual development tools available on a GNU/Linux workstation is a **native toolchain**
- ▶ This toolchain runs on your workstation and generates code for your workstation, usually x86
- ▶ For embedded system development, it is usually impossible or not interesting to use a native toolchain
 - ▶ The target is too restricted in terms of storage and/or memory
 - ▶ The target is very slow compared to your workstation
 - ▶ You may not want to install all development tools on your target.
- ▶ Therefore, **cross-compiling toolchains** are generally used. They run on your workstation but generate code for your target.

Definition (2)

Components

binutils

- ▶ **Binutils** is a set of tools to generate and manipulate binaries for a given CPU architecture
- ▶ **as**, the assembler, that generates binary code from assembler source code
- ▶ **ld**, the linker
- ▶ **ar**, **ranlib**, to generate **.a** archives, used for libraries
- ▶ **objdump**, **readelf**, **size**, **nm**, **strings**, to inspect binaries. Very useful analysis tools !
- ▶ **strip**, to strip useless parts of binaries in order to reduce their size
- ▶ <http://www.gnu.org/software/binutils/>
- ▶ GPL license

Kernel headers (1)

- ▶ The C library and compiled programs need to interact with the kernel
 - ▶ Available system calls and their numbers
 - ▶ Constant definitions
 - ▶ Data structures, etc.
- ▶ Therefore, compiling the C library requires kernel headers, and many applications also require them.
- ▶ Available in `<linux/...>` and `<asm/...>` and a few other directories corresponding to the ones visible in `/usr/include/` in the kernel sources

Kernel headers (2)

- ▶ System call numbers, in `</include/asm/unistd.h>`

```
#define __NR_exit      1
#define __NR_fork      2
#define __NR_read      3
```

- ▶ Constant definitions, here in `</include/asm-generic/fcntl.h>`, included from `</include/asm/fcntl.h>`, included from `</include/linux/fcntl.h>`

```
#define O_RDONLY      00000002
```

- ▶ Data structures, here in `</include/asm/stat.h>`

```
struct stat {
    unsigned long st_dev;
    unsigned long st_ino;
    [...]
};
```

Kernel headers (3)

- ▶ The kernel-to-userspace ABI is backward compatible
- ▶ Binaries generated with a toolchain using kernel headers older than the running kernel will work without problem, but won't be able to use the new system calls, data structures, etc.
- ▶ Binaries generated with a toolchain using kernel headers newer than the running kernel might work on if they don't use the recent features, otherwise they will break
- ▶ Using the latest kernel headers is not necessary, unless access to the new kernel features is needed
- ▶ The kernel headers are extracted from the kernel sources using the `headers_install` kernel `Makefile` target.

GCC compiler

- ▶ GNU C Compiler, the famous free software compiler
- ▶ Can compile C, C++, Ada, Fortran, Java, Objective-C, Objective-C++, and
- ▶ Generate code for a large number of CPU architectures, including **ARM**, AVR, Blackfin, CRIS, FRV, M32, MIPS, MN10300, PowerPC, SH, v850, i386, x86_64, IA64, Xtensa, etc.
- ▶ <http://gcc.gnu.org/>
- ▶ Available under the GPL license, libraries under the LGPL.

C library

- ▶ The C library is an essential component of a Linux system
- ▶ Interface between the applications and the kernel
- ▶ Provides the well-known standard C API to ease application development
- ▶ Several C libraries are available: `glibc`, `uClibc`, `eglibc`, `dietlibc`, `newlib`, etc.
- ▶ The choice of the C library must be made at the time of the cross-compiling toolchain generation, as the GCC compiler is compiled against a specific C library.

glibc

<http://www.gnu.org/software/libc/>

- ▶ License: LGPL
- ▶ C library from the **GNU** project
- ▶ Designed for performance, standards compliance and portability
- ▶ Found on all **GNU / Linux** host systems
- ▶ Of course, actively maintained
- ▶ Quite big for small embedded systems: approx 2.5 MB on **arm** (version 2.9 - **libc**: 1.5 MB, **libm**: 750 KB)
- ▶ 2.18 is current as of Sept-2013

uClibc

<http://www.uclibc.org/> from [CodePoet Consulting](#)

- ▶ License: LGPL
- ▶ Lightweight C library for small embedded systems
- ▶ High configurability: many features can be enabled or disabled through a [menuconfig](#) interface
- ▶ Works only with Linux/uClinux, works on most embedded architectures
- ▶ No stable ABI, different ABI depending on the library configuration
- ▶ Focus on size rather than performance
- ▶ Small compile time

uClibc (2)

- ▶ Most of the applications compile with uClibc. This applies to all applications used in embedded systems.
- ▶ Size (arm): 4 times smaller than [glibc](#)!
[uClibc 0.9.30.1](#): approx. 600 KB ([libuClibc](#): 460 KB, [libm](#): 96KB)
[glibc 2.9](#): approx 2.5 MB
- ▶ Used on a large number of production embedded products, including consumer electronic devices
- ▶ Actively maintained, large developer and user base
- ▶ Now supported by [MontaVista](#), [TimeSys](#) and [Wind River](#).
- ▶ **15 May 2012, uClibc 0.9.33.2 Released**

Honey, I shrunk the programs!

C program	Compiled with shared libraries		Compiled statically	
	glibc	uClibc	glibc	uClibc
Plain "hello world" (stripped)	5.6 K (glibc 2.9)	5.4 K (uClibc 0.9.30.1)	472 K (glibc 2.9)	18 K (uClibc 0.9.30.1)
Busybox (stripped)	245 K (older glibc)	231 K (older uClibc)	843 K (older glibc)	311 K (older uClibc)

Executable size comparison on ARM

eGlibc

« Embedded glibc », under the LGPL

- ▶ Variant of the GNU C Library (GLIBC) designed to work well on embedded systems
- ▶ Strives to be source and binary compatible with GLIBC
- ▶ eGlibc's goals include reduced footprint, configurable components, better support for cross-compilation and cross-testing.
- ▶ Can be built without support for NIS, locales, IPv6, and many other features.
- ▶ Supported by a consortium, with Freescale, MIPS, MontaVista and Wind River as members.
- ▶ The Debian distribution is switching to eGlibc too:
<http://blog.aurel32.net/?p=47>
- ▶ <http://www.eGlibc.org>
- ▶ Thu Sep 5 23:25:59 2013 UTC (2 weeks, 5 days ago) by [joseph](#)

Other smaller C libraries

- ▶ Several other smaller C libraries have been developed, but none of them have the goal of allowing the compilation of large existing applications
- ▶ They need specially written programs and applications
- ▶ Choices :
 - ▶ [Dietlibc](#), <http://www.fefe.de/dietlibc/>. Approximately 70 KB.
 - ▶ [Newlib](#), <http://sources.redhat.com/newlib/>
 - ▶ [Klibc](#), <http://www.kernel.org/pub/linux/libs/klibc/>, designed for use in an initramfs or initrd at boot time. [2.0/](#) 05-Oct-2012 19:08

Building a toolchain

- ▶ Many decisions must be made when building a toolchain
 - ▶ Choosing the C library
 - ▶ Choosing the version of the different components
 - ▶ Choosing the configuration of the toolchain
 - ▶ Which ABI should be used ? Toolchains for the ARM architecture for example, can generate binaries using the OABI (Old ABI) or the EABI (Embedded ABI), that are incompatible
 - ▶ Should the toolchain support software floating point, or does the hardware support floating point operations ?
 - ▶ Should the toolchain support locales, IPv6, or other specific features ?

Get a precompiled toolchain

- ▶ Solution that most people choose, because it is the simplest and most convenient solution
- ▶ First, determine what toolchain you need: CPU, endianism, C library, component versions, ABI, soft float or hard float, etc.
- ▶ Many toolchains are freely available pre-compiled on the Web
- ▶ CodeSourcery, <http://www.mentor.com/embedded-software/codesourcery>, is a reference in that area, but they only provide glibc toolchains.
- ▶ See also <http://elinux.org/Toolchains>

<http://elinux.org/Toolchains>

 - [3.2.5 OSELAS Toolchain\(\)](#)
 - [3.2.6 Bitbake](#)

Installing and using a precompiled toolchain

- ▶ Follow the installation procedure proposed by the vendor
- ▶ Usually, it is simply a matter of extracting a tarball at the proper place
- ▶ Then, add the path to toolchain binaries in your **PATH**:
`export PATH=/path/to/toolchain/bin/:$PATH`

Or

```
host$ export ARCH=arm
host$ export CROSS_COMPILE=arm-linux-gnueabi-
host$ ${CROSS_COMPILE}gcc helloWorld.c
```

Toolchain building utilities (2)

▶ Crosstool

- ▶ The precursor, written by Dan Kegel
- ▶ Set of scripts and patches, glibc-only
- ▶ Not really maintained anymore
- ▶ <http://www.kegel.com/crosstool>

▶ Crosstool-ng

- ▶ Rewrite of Crosstool, with a menuconfig-like configuration system
- ▶ Feature-full: supports uClibc, glibc, eglibc, hard and soft float, many architectures
- ▶ Actively maintained
- ▶ <http://crosstool-ng.org/>

Toolchain building utilities (3)

Many root filesystem building systems also allow the construction of cross-compiling toolchain

▶ Buildroot

- ▶ Makefile-based, uClibc only, maintained by the community
- ▶ <http://buildroot.uclibc.org>

▶ PTXdist

- ▶ Makefile-based, uClibc or glibc, maintained mainly by Pengutronix
- ▶ http://www.pengutronix.de/software/ptxdist/index_en.html

▶ OpenEmbedded

- ▶ The feature-full, but complex building system
- ▶ <http://www.openembedded.org/>

yocto Project

- <https://www.yoctoproject.org/>
- The Yocto Project is an open source collaboration project that provides templates, tools and methods to help you create custom Linux-based systems for embedded products regardless of the hardware architecture.
- It's not an embedded Linux distribution
 - it creates a custom one for you
- <https://www.yoctoproject.org/download/texas-instruments-arm-cortex-a8-development-board-beagleboard-2>
