

## 04-3 Toolchains

## Embedded Linux system development

### Cross-compiling toolchains

Corrections, suggestions, contributions and translations are welcome!

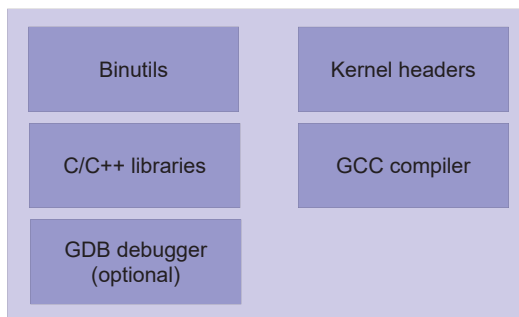

### Definition (1)

- ▶ The usual development tools available on a GNU/Linux workstation is a **native toolchain**
- ▶ This toolchain runs on your workstation and generates code for your workstation, usually x86
- ▶ For embedded system development, it is usually impossible or not interesting to use a native toolchain
  - ▶ The target is too restricted in terms of storage and/or memory
  - ▶ The target is very slow compared to your workstation
  - ▶ You may not want to install all development tools on your target.
- ▶ Therefore, **cross-compiling toolchains** are generally used. They run on your workstation but generate code for your target.

### Definition (2)

### Components

### binutils

- ▶ **Binutils** is a set of tools to generate and manipulate binaries for a given CPU architecture
- ▶ **as**, the assembler, that generates binary code from assembler source code
- ▶ **ld**, the linker
- ▶ **ar, ranlib**, to generate .a archives, used for libraries
- ▶ **objdump, readelf, size, nm, strings**, to inspect binaries. Very useful analysis tools !
- ▶ **strip**, to strip useless parts of binaries in order to reduce their size
- ▶ <http://www.gnu.org/software/binutils/>
- ▶ GPL license

## Kernel headers (1)

- ▶ The C library and compiled programs need to interact with the kernel
  - ▶ Available system calls and their numbers
  - ▶ Constant definitions
  - ▶ Data structures, etc.
- ▶ Therefore, compiling the C library requires kernel headers, and many applications also require them.
- ▶ Available in `<linux/...>` and `<asm/...>` and a few other directories corresponding to the ones visible in `/usr/include/` in the kernel sources

## /usr/include

```

bone$ cd /usr/include
bone $ ls arm-linux-gnueabi/asm
auxvec.h  hwcap.h  kvm_para.h  poll.h  setup.h  socket.h  termbits.h
bitperlong.h  ioctl.h  mman.h  posix_types.h  shmbuf.h  sockios.h  termios.h
byteorder.h  ioclis.h  msgbuf.h  ptrace.h  sigcontext.h  statfs.h  types.h
errno.h  ipcbuf.h  param.h  resource.h  siginfo.h  stat.h  unistd.h
fcntl.h  kvm.h  perf_regs.h  sembuf.h  signal.h  swab.h

bone $ ls asm-generic
auxvec.h  int-164.h  kvm_para.h  poll.h  shmbuf.h  socket.h
termbits.h  int-1164.h  mman-common.h  posix_types.h  shmparam.h  sockios.h
bitaperlong.h  ioctl.h  mman.h  resource.h  siginfo.h  statfs.h  types.h
errno-base.h  ioclis.h  msgbuf.h  sembuf.h  signal-defs.h  stat.h
ucontext.h  fcntl.h  ipcbuf.h  param.h  setup.h  signal.h  swab.h
unistd.h
  
```

## Kernel headers (2)

- ▶ System call numbers, in `</include/asm/unistd.h>`

```

#define __NR_exit      1
#define __NR_fork      2
#define __NR_read      3
  
```
- ▶ Constant definitions, here in `</include/asm-generic/fcntl.h>`, included from `</include/asm/fcntl.h>`, included from `</include/linux/fcntl.h>`

```

#define O_RDWR      00000002
  
```
- ▶ Data structures, here in `</include/asm/stat.h>`

```

struct stat {
    unsigned long  st_dev;
    unsigned long  st_ino;
    [...]
};
  
```

## Kernel headers (3)

- ▶ The kernel-to-userspace ABI is backward compatible
- ▶ Binaries generated with a toolchain using kernel headers older than the running kernel will work without problem, but won't be able to use the new system calls, data structures, etc.
- ▶ Binaries generated with a toolchain using kernel headers newer than the running kernel might work on if they don't use the recent features, otherwise they will break
- ▶ Using the latest kernel headers is not necessary, unless access to the new kernel features is needed
- ▶ The kernel headers are extracted from the kernel sources using the `headers_install` kernel Makefile target.

## GCC compiler

- ▶ GNU C Compiler, the famous free software compiler
- ▶ Can compile C, C++, Ada, Fortran, Java, Objective-C, Objective-C++, and
- ▶ Generate code for a large number of CPU architectures, including **ARM**, AVR, Blackfin, CRIS, FRV, M32, MIPS, MN10300, PowerPC, SH, v850, i386, x86\_64, IA64, Xtensa, etc.
- ▶ <http://gcc.gnu.org/>
- ▶ Available under the GPL license, libraries under the LGPL.

## C library

- ▶ The C library is an essential component of a Linux system
- ▶ Interface between the applications and the kernel
- ▶ Provides the well-known standard C API to ease application development
- ▶ Several C libraries are available: glibc, uClibc, eglibc, dietlibc, newlib, etc.
- ▶ The choice of the C library must be made at the time of the cross-compiling toolchain generation, as the GCC compiler is compiled against a specific C library.

## glibc

<http://www.gnu.org/software/libc/>

- ▶ License: LGPL
- ▶ C library from the GNU project
- ▶ Designed for performance, standards compliance and portability
- ▶ Found on all GNU / Linux host systems
- ▶ Of course, actively maintained
- ▶ Quite big for small embedded systems: approx 2.5 MB on arm (version 2.9 - libc: 1.5 MB, libm: 750 KB)
- ▶ 2016-08-05: [glibc 2.24 released](#).

## uClibc

<http://www.uclibc.org/> from CodePoet Consulting

- ▶ License: LGPL
- ▶ Lightweight C library for small embedded systems
- ▶ High configurability: many features can be enabled or disabled through a [menuconfig](#) interface
- ▶ Works only with Linux/uClinux, works on most embedded architectures
- ▶ No stable ABI, different ABI depending on the library configuration
- ▶ Focus on size rather than performance
- ▶ Small compile time

## uClibc (2)

- ▶ Most of the applications compile with uClibc. This applies to all applications used in embedded systems.
- ▶ Size (arm): 4 times smaller than glibc!  
uClibc 0.9.30.1: approx. 600 KB (libuClibc: 460 KB, libm: 96KB)  
glibc 2.9: approx 2.5 MB
- ▶ Used on a large number of production embedded products, including consumer electronic devices
- ▶ Actively maintained, large developer and user base
- ▶ Now supported by MontaVista, TimeSys and Wind River.
- ▶ **15 May 2012, uClibc 0.9.33.2 Released**

## Honey, I shrunk the programs!

C program	Compiled with shared libraries		Compiled statically	
	glibc	uClibc	glibc	uClibc
Plain "hello world" (stripped)	5.6 K (glibc 2.9)	5.4 K (uClibc 0.9.30.1)	472 K (glibc 2.9)	18 K (uClibc 0.9.30.1)
Busybox (stripped)	245 K (older glibc)	231 K (older uClibc)	843 K (older glibc)	311 K (older uClibc)

Executable size comparison on ARM

## eglibc

« Embedded glibc », under the LGPL

- ▶ Variant of the GNU C Library (GLIBC) designed to work well on embedded systems
- ▶ Strives to be source and binary compatible with GLIBC
- ▶ eglibc's goals include reduced footprint, configurable components, better support for cross-compilation and cross-testing.
- ▶ Can be built without support for NIS, locales, IPv6, and many other features.
- ▶ Supported by a consortium, with Freescale, MIPS, MontaVista and Wind River as members.
- ▶ <http://www.eglibc.org>
- ▶ Mon Sep 29 20:30:30 2014 UTC (23 months, 4 weeks ago) by joseph
- ▶ This is the final release branch of EGLIBC; users and developers should now move back to GLIBC and develop it as needed in accordance with the goals of EGLIBC.

## Other smaller C libraries

- ▶ Several other smaller C libraries have been developed, but none of them have the goal of allowing the compilation of large existing applications
- ▶ They need specially written programs and applications
- ▶ Choices :
  - ▶ Dietlibc, <http://www.fefe.de/dietlibc/>. Approximately 70 KB.
  - ▶ Newlib, <http://sources.redhat.com/newlib/> (2016-03-29: [Newlib version 2.4.0 is released](#))
  - ▶ Klibc, <http://www.kernel.org/pub/linux/libs/klibc/>, designed for use in an initramfs or initrd at boot time. [2.0/](#) 05-Oct-2012 19:08

## Get a precompiled toolchain

- ▶ Solution that most people choose, because it is the simplest and most convenient solution
- ▶ First, determine what toolchain you need: CPU, endianness, C library, component versions, ABI, soft float or hard float, etc.
- ▶ Many toolchains are freely available pre-compiled on the Web
- ▶ CodeSourcery, <http://www.mentor.com/embedded-software/codesourcery>, is a reference in that area, but they only provide glibc toolchains.
- ▶ See also <http://elinux.org/Toolchains>

## <http://elinux.org/Toolchains>

    - [3.2.6 Bitbake](#)

## Installing and using a precompiled toolchain

- ▶ Follow the installation procedure proposed by the vendor
- ▶ Usually, it is simply a matter of extracting a tarball at the proper place
- ▶ Then, add the path to toolchain binaries in your PATH:  
`export PATH=/path/to/toolchain/bin:$PATH`

Or

```
host$ export ARCH=arm
host$ export CROSS_COMPILE= arm-linux-gnueabi-
host$ PATH=$PATH:~/BeagleBoard/bb-
kernel/dl/gcc-linaro-5.3-2016.02-x86_64_arm-
linux-gnueabi/bin
host$ ${CROSS_COMPILE}gcc helloWorld.c
```
