O6-3 Userspace Initialization Chapter 6

Initialization

- Chapter 5 Kernel Initialization
- Chapter 6 Userspace Initialization

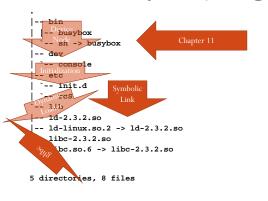

Chapter 6 - Userspace Initialization

- At startup
 - Kernel initializes
 - Mounts a root file system
 - Executes set of initialization routines
- We'll start with a minimal filesystem and build on it

Root File System: Top-Level Directories

	Directory	Contents
host\$ tree	bin	Binary executables, usable by all users on the system
/	dev	Device nodes (see Chapter 8, "Device Driver Basics")
bin	etc	Local system configuration files
dev	home	User account files
etc	lib	System libraries, such as the standard C library and many
home		others
lib	sbin	Binary executables usually reserved for superuser
sbin		accounts on the system
usr	usr	A secondary file system hierarchy for application programs, usually read-only
var	var	Contains variable files, such as system logs and temporary
` tmp		configuration files
	tmp	Temporary files

Minimal File System (Listing 6-1)

The Embedded Root FS Challenge

- Don't have large hard drive or flash storage
- Hard to tell what depends on what
- Two approaches
 - Trial-and-Error
 - Automated
 - bitbake (<u>www.openembedded.org</u>)
 - Buildroot (http://buildroot.uclibc.org/)

Kernel's Last Boot Steps (main.c)

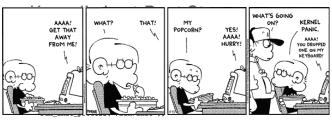

Page 138

- Final sequence of events for the kernel thread called kernel_init spawned by the kernel during the final stages of boot
- run_init_process() is a small wrapper around the execve() function, which is a kernel system call
- execve() function never returns if no error conditions
- Memory space in which the calling thread is executing from is overwritten by the called program's memory image
- In effect, the called program directly replaces the calling thread, including inheriting its Process ID (PID)

Kernel's Last Boot Steps

Page 138 (cont.)

- This is the start of user space processing
- Unless the kernel is successful in executing one of these processes, the kernel will halt, displaying the message passed in the panic() system call
- If you have been working with embedded systems for any length of time, and especially if you have experience working on root file systems, you are more than familiar with this kernel panic() and its message!
- If you search on Google for this panic() error message, you
 will find page after page of hits for this FAQ.
- When you complete this chapter, you will be an expert at troubleshooting this common failure.

run_init_process("/bin/sh");

```
panic("No init found. Try passing init=
option to kernel.");
```

First User Space Program

• Most systems: /sbin/init is spawned.

```
-- bin
 -- busybox
 -- sh -> busybox
 - dev
                              run init process("/sbin/init");
 '-- console
                             run_init_process("/etc/init");
                             run_init_process("/bin/init");
-- etc
 '-- init.d
                             run_init_process("/bin/sh");
'-- rcs
 -- lib
|-- 1d-2.3.2.so
-- ld-linux.so.2 -> ld-2.3.2.so
|-- libc-2.3.2.so
-- libc.so.6 -> libc-2.3.2.so
```

Resolving Dependencies

- You can't put just any program as init
- There may be dependencies

host\$ ldd a.out
linux-gate.so.1 => (0x002df000)
libc.so.6 => /lib/tls/i686/cmov/libc.so.6 (0x00da8000)
/lib/ld-linux.so.2 (0x00a92000)

• To do: find cross version of ldd.

Customized Initial Process

console=ttyS0,115200 ip=bootp
root=/dev/nfs init=/sbin/myinit

The init process

- Use standard init
- Reads /etc/inittab
- # /etc/inittab: init(8) configuration.
 # \$Id: inittab,v 1.91 2002/01/25 13:35:21 miquels Exp \$
- # The default runlevel.

id:5:initdefault:

- # Boot-time system configuration/initialization script.
- # This is run first except when booting in emergency (-b) mode. si::sysinit:/etc/init.d/rcS

The init process

- # What to do in single-user mode.
- ~~:S:wait:/sbin/sulogin
- $\mbox{\#}$ /etc/init.d executes the S and K scripts upon change $\mbox{\#}$ of runlevel.

10:0:wait:/etc/init.d/rc 0
11:1:wait:/etc/init.d/rc 1
12:2:wait:/etc/init.d/rc 2
13:3:wait:/etc/init.d/rc 4
15:5:wait:/etc/init.d/rc 5

16:6:wait:/etc/init.d/rc 6

The init process

- # Normally not reached, but fallthrough in case of emergency.
 z6:6:respawn:/sbin/sulogin
 S:2345:respawn:/sbin/getty 115200 ttyS2
 # /sbin/getty invocations for the runlevels.
 #
- # The "id" field MUST be the same as the last # characters of the device (after "tty").
- # Format:
- <id>:<runlevels>:<action>:

1:2345:respawn:/sbin/getty 38400 tty1

Runlevels

Runlevel	Purpose	
0	System shutdown (halt)	
1	Single-user system configuration for maintenance	
2	User defined	
3	General purpose multiuser configuration	
4	User defined	
5	Multiuser with graphical user interface on startup	
6	System restart (reboot)	

- Runlevel scripts are found in /etc/rc.d/init.d/
- or /etc/init.d/

NFS Restart

\$ /etc/rc.d/init.d/nfs restart

```
Shutting down NFS mountd: [ OK ]
Shutting down NFS daemon: [ OK ]
Shutting down NFS quotas: [ OK ]
Shutting down NFS services: [ OK ]
Starting NFS services: [ OK ]
Starting NFS quotas: [ OK ]
Starting NFS daemon: [ OK ]
Starting NFS mountd: [ OK ]
```

Runlevel Directory Structure on Beagle

```
beagle$ ls -dl /etc/rc*
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc0.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc1.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc2.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc3.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc4.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc5.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc6.d
drwxr-xr-x 2 root root 4096 Mar 13 20:18 /etc/rc6.d
```

Example Runlevel Directory on Beagle

```
beagle% ls -ls rc5.d/
total 0

O lrwxrwxrwx 1 root root 20 Mar 13 20:18 805led-config -> ../init.d/led-config
O lrwxrwxrwx 1 root root 18 Mar 13 20:18 810dropbear -> ../init.d/dropbear
O lrwxrwxrwx 1 root root 14 Mar 13 20:18 820apmd -> ../init.d/apmd
O lrwxrwxrwx 1 root root 16 Mar 13 20:18 820apmd -> ../init.d/dpus-1
O lrwxrwxrwx 1 root root 16 Mar 13 20:18 820apmd -> ../init.d/apwlog
O lrwxrwxrwx 1 root root 22 Mar 13 20:18 822odnum-1 -> ../init.d/connman
O lrwxrwxrwx 1 root root 17 Mar 13 20:18 822connman -> ../init.d/connman
O lrwxrwxrwx 1 root root 17 Mar 13 20:18 822connman -> ../init.d/connman
O lrwxrwxrwx 1 root root 20 Mar 13 20:18 830ntpdate -> ../init.d/ntpdate
O lrwxrwxrwx 1 root root 20 Mar 13 20:18 859pm-dm -> ../init.d/gpe-dm
O lrwxrwxrwx 1 root root 16 Mar 13 20:18 859pm-ologin -> ../init.d/zmologin
O lrwxrwxrwx 1 root root 18 Mar 13 20:18 859pm-ologin -> ../init.d/zmologin
O lrwxrwxrwx 1 root root 20 Mar 13 899pp-dm -> ../init.d/zmologin
```

Runlevel 5
